Employing Task-based Video-making Learning to Develop EFL Students' Multimodal Competencies

Chia-Ching Lin[1]

Abstract

The pedagogical approach to speaking class for EFL students is changing since the integration of technology. Technology, by offering a multimodal learning environment, is one of the ways to enhance and maximize students' learning experience and their multiple competencies. This study aims to explore students' perception and develop their learning strategies of multimodal learning. By employing a task-based approach, an English conversation course combined multimodal learning which can change the approach to learning English, engage students in learning, and help students cultivate multiple literacies. The students' feedback was transcribed as the qualitative analysis, concerning about what they learned in language skills, and their reflection in overcoming difficulties in technical problems and disagreement with their team partners. The results found that students not only were meta-cognitively aware of the improvement in English proficiency but also cultivated their multimodal competencies including self-learning regulation, techno-literacy and empathic collaboration. This study also indicated implications for language instructors and learners.

Keywords: multimodal learning, competency, EFL conversation course

1. INTRODUCTION

English college majors in Taiwan are required to take English conversation course as their foundational training and grounding for the advanced language skills. Given that it is the mandatory course for English majors in their first two years of college life, the first and foremost objective of the course aims to develop students' basic speaking skills that can be utilized in real life situations. However, the problem in EFL English conversation class in Taiwan is that the teacher is unable to have enough practice with each student in a 2-hour class every week since at least 30 students are enrolled in each class. It is difficult to engage every student in the class at the same time if the teacher is practicing with certain group of students. They are often distracted probably by some small things like their instant messages pop out of cell phones or other classmates' chat. Some students, due to lack of confidence and insufficient linguistic knowledge, easily fail to effectively express themselves in English. They feel anxious when speaking English. Besides, students seldom have opportunities applying what they learned in real life probably since they do not accustom themselves to speaking English in different actual circumstances (Chien, Hwang, & Jong, 2020). In response to fostering students with multiple skills and competencies and encouraging them to more actively join the class activities, educators are trying to transform traditional teaching into more diverse approaches to learning English. Technological advancement changes the teaching environment from fully textual to multiple modalities, offering more assistances to teachers and students so as to make English conversation more relevant to everyone's real life experience. By widespread use, technology creates an environment for developing multimodal learning. Multimodal learning uses different materials, such as multimedia, online social community, and digital visual tools, to reconstruct a "pseudo-natural" environment to help learners relate what they learn to the real-life experiences. Learners develop multi-literacies under a variety of context applications. Multimodal learning initiates learners' different sensory modalities, thus prompting motivation, innovating new ideas and course quality (Shah & Freedman, 2003). Video making, by applying digital tools, develops students' multimodal competencies in learning

authentic materials adopted from real life experiences. It is often used in EFL conversation course which can develop both English speaking ability and students' multimodal competencies (Yeh, 2018; Hafner & Miller, 2011; King, 2010). Taking a college EFL conversation class in Taiwan as its example, this study conducted an experiment about carrying out a task-based learning by making a short video about their everyday life on campus in order to observe students' perception of multimodal learning and what multiple competencies are cultivated.

2. LITERATURE REVIEW

2.1 Problems in Taiwan EFL Conversation Class

English conversation class is requisite for English majors in Taiwan college. By taking this course in the first two years of college, students have to develop fundamental English conversation abilities dealing with everyday situation such as greeting people, checking suggestion, responding to news, meeting, giving advice, discussing issues, making a public oral presentation, and challenging others' ideas. Speaking, among four skills, is the most esteemed by beginning- and intermediate-level L2 learners (Chuang, 2011). It is important to speak English effectively both in academic fields and in the future workplace, especially in the global market. That being so, English conversation class not only provides the training of speaking skills but also cultivates students' other competencies such as speculative abilities, social relationships, and emotional intelligence (Afshar & Rahimi, 2014; Bora, 2012; Iman, 2017; Wang, 2009). With the advancement of technology, the pedagogical instruction in conversation class combines textbook use with adopting supplementary materials to enhance learners' foundational linguistic knowledge as well as application in real life situations. The question is what and how to appropriately use textbooks and supplementary materials to motivate and engage students in class. Students often feel anxious when speaking English in class since, according to Black (2019), speaking in public is a "glossophobia" to most people. People try to avoid speak in public because it fills them with panic and fear.

There are other factors that influence EFL students' performance in speaking course, such as educational policy, lack of motivation, self-confidence, and authentic

materials for practice. In Taiwan, teachers face the challenges such as large class size and limited class hours (usually 2 hours every week) that constraint the learning effectiveness (Su, 2006). Students do not have enough time practicing with their teachers and classmates, let alone after class. Taiwanese students are not accustomed to speaking English in the Chinese-speaking environment (Liu, 2006). Savasci (2014) indicated that students in speaking class are not motivated due to the conventional and tedious teaching method that emphasizes memorizing vocabulary and phrases. Students do not actively participate in speaking practice or activities which they think boring or fear of making mistakes. In such environment, students' autonomy and self-regulated learning are not inspired. Students' confidence is thus diminished due to low speaking proficiency. Students may feel anxious about speaking English with their teacher due to lack of confidence and the uneasiness associated with making mistakes (Dwyer & Heller-Murphy, 1996; Chou, 2018; Tridinanti, 2018). They are worried that they don't have enough vocabulary to express themselves in the real-life situations. That being said, in traditional teaching approach, the classroom seems to be the only place to practice speaking; students therefore should be provided with more opportunities practicing (Chien et al., 2020). Another possible result from traditional classroom is lack of peer interaction. Learning with peers can reduce anxiety and students will be more aware of what and how they are learning. Chien et al. (2020) found that peer assessment and feedback increased students' reflection in English-speaking performance. Collaboration among peers integrates the process of experiential "learning by doing": the application of knowledge, implementation of task-based activities and reflection on learning to create new knowledge can actively and substantially benefit learners' ability to connect context and theory (Kolb, 1984; Knutson, 2003; Moore, 2018; Tawil, 2018). Studying with classmates, such as project-oriented language learning, can increase motivation as well as reduce anxiety (Chuang, 2010). Task-based learning, indicated by Chuang's (2010) survey, is also a more objective way of assessment. Through the peer team work, students mutually cooperate to work out and overcome the difficulties. Communicative skills are enhanced and thus enable students to think how they use language for certain tasks. Peer interaction can initiate more creativity and production (e.g. Savitri & Sundari, 2021; Marashi & Dadari, 2012). Besides reducing anxiety, the peer mutual feedback

benefited students in critical thinking and learning achievement. Moreover, engaging students speaking English in real life is what language learning should activate and boost (Illes & Akcan, 2016). Since technology prompts innovation in education, it can help improve teaching methods and learning strategies by providing a variety of resources and multiple language learning contexts.

2.2 Multimodal Learning and Video Making in EFL Teaching and Learning

Everyone should learn to respond to different complex situations that require one with competencies so as to be more reflective on current and future cultural, social, and economic incidents, moving towards a more sustainable society (Eizaguirre, Garcia-Feijoo & Laka, 2019). Given that it is advocated that learning should cultivate learners' different and cross-field competencies, educators put more and more emphasis on multimodal literacies to respond to the increasing learning needs and assistance because of technological evolvement. Multimodality, referred as a semiotic design or product, combines two or more different texts or sources, such as digital images and verbal speeches, to express meaning in communication (Kress & Van Leeuwen, 2001; Adami, 2017). New London Group (1996) defined "multimodal patterns of meaning" as containing five interconnected design elements: linguistic, visual, audio, gestural and spatial. Multimodal learning situated learners in various types of sources that are related to life experiences. Multimodal learning needs to use real life examples in which learners develop multiple skills and competencies from these materials and sources (Jewitt, 2008; Nouri, 2019). The extent research found that different sources and media helped enhanced EFL learners' motivation. In Lee's (2014) study, visual materials, such as arts, digital video stories, and dynamic images, were integrated into EFL composition class to raise students' positive attitude in language learning. Making digital video stories is a process of self-reflection, interpretation and transmission on what students have learned or they are still learning (Gregori Signes, 2008). Hafner & Miller (2011) indicated that when making digital stories, students have to connect traditional with new literacies. The task of making digital stories should contain different roles like script writer, director, and editor. Furthermore, making digital stories require multimodal skills such as "research skills (e.g., finding and analyzing information), writing skills (e.g., preparing a script),

organizational skills (e.g., managing the project), technology skills (e.g., learning new multimedia skills), presentation skills (e.g., deciding how best to present information to an audience), interpersonal skills (e.g., working with team-mates), problem solving skills (e.g., making decisions about the project), and evaluation skills (e.g., critiquing own and others' work)" (Robin, 2006, p. 5). The process of making stories, based on Rance-Roney (2008), is "deep language acquisition and meaningful practice."

New technology and its practices can offer easy access and interaction to language teaching (Banados, 2006) and encourage learners' autonomous learning (Benson, 2001; Motteram, 1997). To achieve and accomplish the learning objective, it is important that learners are prompted to contemplate their learning behavior and adjust learning strategies (Pintrich & De Groot, 1990; Schunk, 1996). The process of autonomous learning is profoundly related to leaner's motivation, self-control, and metacognitive strategies (Trawick & Corno, 1995). In a metacognitive instructional multimodal learning, Torres, Salamanca, Cely, & Aguilar (2020) found that the students were aware of the benefits in employing technological instrument and recognized how this instrument improved their English proficiency. The students' confidence was thus built up during the metacognitive learning process. A pedagogical instruction concerning about students' affordances and connecting technology with teaching and learning should be appropriately applied to enhance students' motivation in the process of multimodal learning (Hafner & Miller, 2011). Multimedia-assisted learning could provide learners with authentic materials, arousing learning motivation. Jeong (2018) investigated the impact of authentic multimedia on students' communication skills and their perception of technology-enhanced instruction. The results found that students engaged much more in learning and improved their communication competence because multimedia offered entertaining and informative environment. After relating visual-auditory-reading-kinesthetic (VARK) modal to multimodal learning in assessing students' oral presentation, Lee (2019) found that students' oral presentation skills had a significant improvement in virtue of the technology-mediated approach. Visual materials have been widely recognized as a means of enhancing learners' motivation and speaking skills (Shrosbree, 2008; King, 2010; Yang & Wu, 2012; Lestari, 2019). Video making applied in EFL conversation course can transform

verbal texts into multiple modes of meaning making in an interactive and authentic environment. It not only betters students' use of authentic language but also cultivates students' other literacies like project-management, autonomous learning, techno-solution, and communication skills (Dooly & Masats, 2011; Hasanah & Pradana, 2019). By means of engaging students in the collaborative environment, students, in mutual support and interaction, can use their individual talents and strengths in the project work, deepening their learning effectively (Nguyen, 2013). Jewitt (2005) points out that "a multimodal approach presents students with different potentials for engagement with a text." Thus, by video making, students reach a reasonable level of linguistic as well as multimodal competences (Yeh, 2018). By creating an authentic environment, learners' acquisition of speaking skills as well as multiple literacies are enhanced successfully. Therefore, the research questions of this study are as follows:

1. What is students' perception of video-making in EFL conversation course?
2. In what aspect does video-making develop students' multimodal literacies?

3. METHOD AND MEASUREMENT INSTRUMENT

3.1 Participants

This study investigated students' performance in multimodal learning environment by taking English conversation course in a Taiwan vocational college as an example. This compulsory subject is a 2-hour class every week. The students' major is primarily in business field. They took a TOEIC exam when they just entered this college. According to the TOEIC grading reports, their English proficiency ranged from CEFR B1 to CEFR B2. 28 students in total, including 11 males and 17 females, were recruited in this class. Each student's consent about this experiment had been procured before the class started.

3.2 The Experimental Procedures in English Conversation Class

In this study, the students were required to finish a task about making a 10-minute short film themed as the Taiwanese college students' life. In order to even the number of team members in each group, the students were divided into 7 groups.

Each group, with 4 members, was allowed to invite whoever the students want to team up with. They would feel more comfortable with whom are familiar with. Then the teacher encouraged each member to think about his/her possible role in the ensuing task, such as a coordinator, a resource investigator, an implementer, or a shaper[1], for the purpose of motivating the students' exploration of inner self or respective specialty to engage themselves more in the activity. In the process, a pedagogical instruction on both English conversation in daily life and technological skills was conducted for preparation and support of video making. The teacher, also the researcher, then had a discussion with students about their topics of the micro-film. Story plots and elements were further lectured by the teacher to increase the students' knowledge of making a story. The students shared their ideas and the possible problems they might encounter with the teacher and other classmates. The teacher then guided them trying to think about the solutions to the problem in the process of video making. After the completion of the task, the students were encouraged to send their feedback anonymously. The following figure displays the research framework:

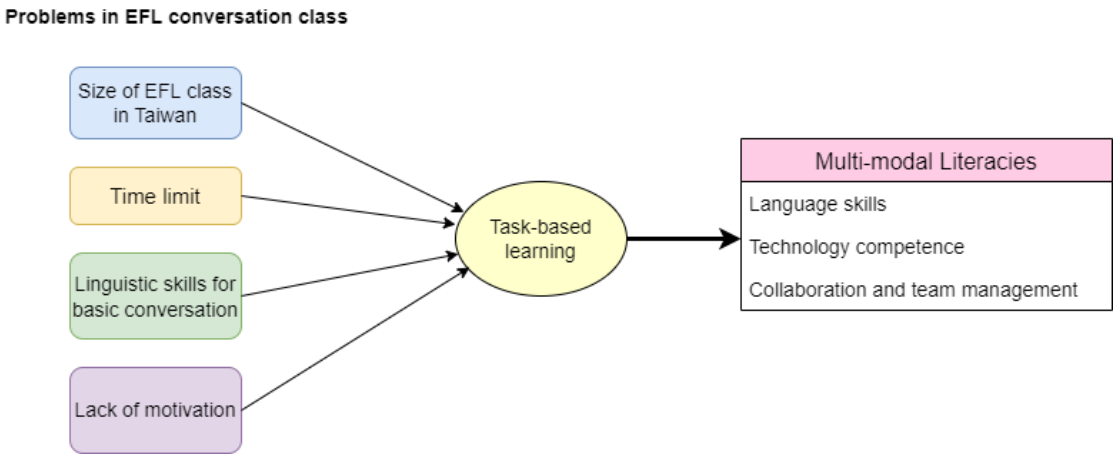

Figure 1 The Research Framework

3.3 Instruments

This study primarily took students' oral and written productions as its measurement instruments. The students' feedback, such as the perception of

[1] The types of roles in teamwork were derived from Belbin (1993).

improvement in language skills, the perception of technology implementation, the problems in the process of video making, and project planning as well as collaborative management, was collected to analyze the students' performance and their perception in multimodal learning environment. The feedback was collected and categorized to observe how they learned English speaking through video making and how multimodal learning developed their competencies.

To ensure the completeness and coherence of the work, three steps in making the short film were required by the teacher, as the following brief statements:

(1) Searching information and materials

To enrich students' knowledge of making a story, the teacher lectured about how the story plot develops and its basic elements in a story, such as characters, settings, conflict, and resolution, by leading a discussion on different types and genres of reading materials. Besides story plots, some other basic stages of making a film, like pre-production, photography, acting, costume and make-up, sound and music, and post-production, were introduced by an experienced director. Students also found some information on audio-visual platforms. Then the students were grouped and sorted out the information they needed for their topic. They also decided what style and type of their film was according to the materials they collected.

(2) Script writing and revision (authentic use of language)

Once deciding the topic, the students began to write the scripts. Guided by the teacher, their scripts were revised many times to meet the authentic use of verbal language. In this process, another teacher who is a native speaker helped provide and modify students' scripts with more authentic examples used in everyday situations. Students also had to plan the storyline to make their scripts logical and fluent.

(3) Film shooting and editing

The students then started film shooting in which they developed their multimodal competencies. They combined what they learned about language skills as well as operation of digital multimedia tools to film and edit their work. They also had to tackle problems caused by teamwork, such as communication, negotiation, job distribution, and time management. In post-production, they learned to edit and caption the film.

4. FINDINGS AND DISCUSSION

After completing the film, the students were encouraged to send their feedback in written reports. The teacher designed a template board from online learning platform along with several sample questions to guide their self-reflection. The students could answer any question that inspired them or reflect anything other than the questions. The sample questions were:

(1) To what extent does the task help you in English language skills (e.g. listening, speaking, reading, and writing)?
(2) What is the most enjoyable thing about the task? Why?
(3) What other things did you learn from making a digital video?
(4) What difficulties did you encounter in this task? How did you overcome it?
(5) What was the most challenging in making this task? How did you overcome it?
(6) Any problems in the process of collaborative teamwork and management? How did you overcome it?

The students handed in 7 copies of written group reports, of each containing at least 500 words. Each student contributed a paragraph of their own reflection after accomplishing the task. Referred to and adapted from the important concept and goal of multimodal learning in relevant research (e.g. Yang & Wu, 2012; Jeong, 2018; Yeh, 2018), this study classified the students' reflection into 3 categories:

(1) Perception of language learning in four skills
(2) Perception of technology implementation
(3) Project planning and collaborative management

Table 1 displays the frequencies of the above three categorized reflections mentioned in students' group reports. To visualize students' learning, Figure 2 displays the learning procedure and the results after students learned to make a video clip.

Table **1.**
Students' reflection after the task

Categories	Sub-categories	Frequencies
Perception of language learning in four skills	Writing	7
	Speaking	6
	Reading	4
	Listening	2
Perception of technology implementation	Mechanic Skills	5
	Post-production	4
	Future Intention	2
Project planning and collaborative management	Cooperation	9
	Competence	8

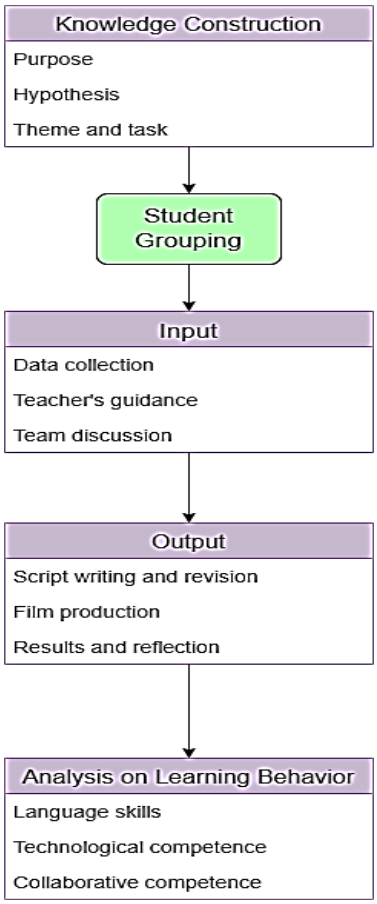

Figure 2 Learning procedure and output performance

The Followings are the discussion of each individual category.

4.1 Perception of Language Learning in Four Skills

From the group reports, most of the students held an affirmative and positive attitude toward video making applied in EFL speaking course. From the above statistics, their group reports showed that they could benefit from video making on developing language skills as much as collaboration in the task. For developing four skills, each of the 7 group reports regarded writing scripts just as much important as speaking because they think writing scripts is not like writing academic reports or essays; without a well-written script for spoken language, the performance cannot go smoothly. The students indicated that they often had problems of distinguishing oral from written language: "Writing a script is not an easy work. We can't do it like writing an essay. We need to write the daily conversation. It is unfamiliar for us to write" (*Group Report No. 5*). The report of *Group No. 7* also considered avoiding written language in the script as an essential step before shooting the film. Using correct spoken language would make their dialogues sound more natural. Besides, students also felt confused about the translation such as the names of campus buildings or Chinese buzzwords when they tried to introduce their campus life. To transform from Chinese into English, they had to look for and read more information and advice from native-speaking English teachers and friends to avoid cultural misunderstanding. During the process, the students learned more about what authentic language was.

Limited from linguistic knowledge, the students sought help for language use. Besides native-speaking English teachers and friends mentioned above, the teacher in this course guided them for obtaining authentic materials for verbal expression. The process of writing the scripts enlarged their lexical and syntactical knowledge in using authentic language, congruent to the research results of Hafner & Miller (2011) and Yeh (2018). While developing their scripts, they did a lot of reading obtaining from print materials as well as digital contexts. Most students agreed that they learned authentic use of language and felt more confident of applying it to other situation in the future. They did not worry if their pronunciation was correct. If there was some word that they did not know how to pronounce, they would ask for advice and kept practicing it. Instead, they were concerned about speaking like a native speaker's

accent (*Group Reports No. 1 and 5*). Like writing the script, they think the dialogues should be more natural, not like those in paper or written contexts. Besides asking help for the teacher, they tried searching for materials on the internet, such as multimedia and mobile learning APP, to make themselves sound more like a native speaker. Their ability of application on online social media was thus advanced. Besides, as the previous studies have noted, through video production, students' speaking ability were greatly improved (e. g., Chen, 2019). In this study, the students think their speaking became more fluent (*Group Report No. 6*). During video shooting, the students in *Group No. 7* figured out another way to present a good performance by trying not to memorize all the written scripts; instead, they verbalized what they thought, not violating the original storyline. The students were aware that speaking English is an internalized process: thinking in English and it could be retained longer in their mind. Instant response in acting during filming was also accentuated because it trained the speaking skills and reaction (*Group Report No. 1*). However, listening ability was not mentioned as many times as other skills. It was supposed that students were confident of their pronunciation while only worried about their vernacular accent from Mandarin. It seems that while they were imitating a native speaker, they were unaware of practicing listening synchronously.

The process of collecting information and materials was a reading comprehension to students. The students did a lot of searching, reading, and sorting out the information they needed. This process also enabled students to decide what kind of type of their film was which was related to story plot. The students worked together to figure out the story plot. This collaborative writing helped them plan the storyline more clearly. Prior knowledge is story elements. Students reported that they "needed to consider the story elements that the teacher taught us so as to make an attractive story" (*Group Report No. 2*). Logical and smooth dialogue can make better presentation (*Group Report No. 4*). *Group No. 7* reported that during the script writing, the script writer had to put herself into each character's shoes in order to make a proper dialogue and response. Scripts had been revised for many times because a lot of talk and discussion with each character was requisite (*Group Report No. 2*). The production of the script was a process of practice writing as well as speaking. Furthermore, planning the storyline needed collaborative team work

because it is important to reach a consensus to continue the impending work.

4.2 Perception of Technology Implementation

In addition to linguistic knowledge and skills, the students' reflection highlighted the importance of technological prowess. The statistical results found three sub-categories in this part, including mechanic skills, post-production, and students' future intention to develop their digital and filming literacies. To solve the problems of mechanical operation, they depended on the internet a lot to empower their knowledge and competence of technology. For example, the background noise during live recording often disturbed or interfere the characters' voice (*Group Reports No. 1, 6, & 7*). Moving to other locations, suspending filming, borrowing high-effective microphones, and eliminating the background noise in post-production were solutions that students often employed. The students also indicated that there were problems in post-production, such as captioning, editing background music, and film editing. By surfing teaching videos on the internet, they solved the problems. This shows that online social media such as Facebook or Youtube could also satisfy people with educational function. These online platforms provide an alternative approach of learning as well as develop learners' creativity. This echoed to the recent studies foregrounding students' creativity from media sources and technology rather than consuming (Howell, Perez, & Abraham, 2020; Hafner & Miller, 2011). Technology not only assists teaching and learning as auxiliary equipment but also offers as an operative implement for output production. The students can profit from technology both in absorbing knowledge and in nurturing multi-literacies. On the whole, most students took a positive attitude toward the task because it was an opportunity for them to approach technological tools. They "enjoyed doing the task" (*Group Reports No. 1, 3, & 5*) and even "decide to save money to buy my own camera in my life to learn more about photography" (*Group Report No. 1*).

4.3 Project Planning and Collaborative Management

Team task not only enhanced students' language and technological skills but also consolidated their sense of group identity. This study listed two sub-items in this section: cooperation and competence. Cooperation encompasses communication, problem-solving, and interrelationship while competence emphasizes on the literacies developed in teamwork, such as time management, creativity, organization, and

leadership. Some students in the beginning had doubts about why video-making being relevant to English learning (*Group Report No. 2*). It was the students' self-reflection through discussion that they agreed and compromised the value of video-making: "I think conducting a digital video production can benefit ourselves not just in language learning; it is a way that we can reinforce ourselves in other fields" (*Group Report No. 2*). Congruent to the results of Hafner & Miller (2011), in this collaborative work, the students learned to manage and organize a team even though they "argued a lot, trying to understand how to put everyone in the correct position so as to finish the task" (*Group Reports No. 2, 5, & 7*). Peer feedback, as Chien et al. (2020) mentioned, was helpful in English speaking performance. Through peer amendment, the students corrected their errors promptly (*Group Report No. 4*). Collaboration prompted a significant impact on stimulating peer imitation. Communicating skills, coordination, leadership, and time management were also mentioned in their feedback: "As the team leader, I was like a coordinator as well as counseling psychiatrist served for the team members when they had difficulties or frustration (*Group Report No. 4*)". Furthermore, teamwork fostered students' social interaction and sense of responsibility. As Chen (2018) examined students' digital empathy by engaging them in video making, digital empathy raises students' awareness of social responsibility while employing technology in learning and life. The students' feedback in this study revealed that responsibility was one of the important things they experienced in the process. This task enabled them a deeper understanding of team work. Collaboration depends not on one person, but on every member's effort and consensus.

All in all, students enjoyed working with their classmates and had a great sense of achievement because it was a great opportunity to unite them together, such as the excerpts below:

> Life is like a play whereas it cannot be replayed. Our lifetime allows us to present our performance only one time. Once you screw it up, you cannot make the time returned. From the task, we learned much more than we can imagine. (*Group Report No. 2*)
>
> We enjoyed this task because there is little chance making a film of our own.

Despite the difficulties, we were always thrilled when shooting the film and expected to watch our work. We always kept smiling unconsciously facing the camera. (*Group Report No. 3*)

5. CONCLUSION

To activate what English conversation course taught in real life, this study explored students' perception of multimodal learning and how it enacted students' multi-literacies in the task of video-making. Besides enhancing speaking ability, the students meta-cognitively monitored and developed their language learning strategies, using more authentic semantic modes in their dialogues. These verbal spoken words retained in the students' mind which helped them confront different situations in the future. In the process of composing the scripts, the students re-organized, retained and selected what they have learned and associated it within the real life situation. It increased their exposure to the target language and promoted their self-awareness and motivation of speaking English. Besides asking help for their teachers, they did a lot of research by scanning and sorting out information on the internet and social media. Their techno-literacies were also fostered and advanced during filming and editing the video. As the so called "digital natives", the students depended a lot on technological assistance which may arouse their motivation of implementing technology in language learning. It was also found that students reflected much on their interpersonal relationships and fellowship which would be indispensable in the future workplace. Most students enjoyed the process of shooting videos, performing, post-production, and negotiating with the classmates like work-load distribution. To put it in a nutshell, this study shows offers various ways of evaluation in EFL classroom which engage more students synchronously in participating in course activities and enhance their multimodal competencies. The extent research has indicated that integration of technology in multimodal learning environment may facilitate students' learning cognition and meta-cognitive self-regulated learning (Azevedo, 2009). Since language learning is dynamic, especially in the post-pandemic era where both teachers and students are forced to adapt different

ways of learning, this study suggests different aspects and learning strategies can be employed for future hybrid pedagogical instruction in EFL conversation course.

6. LIMITATUONS SND RECOMMENDATIONS FOR FUTURE RESEARCH

There are some limitations in this study, though, namely the sample size, time limitation, and other measurement that should be considered to investigate students' perception of multimodal learning. The sample size in this study only contained 7 groups, 28 students in total, which may not represent the whole panorama about the research theme. English learning needs a long-term practice. If the instruction, in a more longitude experiment, offers various types of activities, students' motivation and learning effectiveness can be carefully observed and analyzed. The last limitation is the measurement tool. More raters' observation and assessment, instead of only one instructor's, could enhance the credibility of the experimental results. This study mostly used qualitative analysis to categorize students' perception and learning strategies in multimodal learning environment. It could be added quantitative tools to analyze the result if sample size is large. Students' time sequential behavior during the process of the multimodal learning activities could also be a reference for the future relevant study. It is hoped that these limitations can be conquered in future research.

運用任務導向影片創作學習培養大學生的多模態素養能力

林佳靜 [1]

摘要

科技融入改變了 EFL 英語口說課程的教學方式。科技提供多模態學習（multimodal learning）環境，英語口說課程不只增強學習經驗、英語專業，且培養學生的多元跨領域素養，在後疫情時代提供教育現場多重教學選擇。本研究經由任務導向教學方法，探討學生對多模態學習的感受以及學習經驗。實驗對象為臺灣中部一所科技大學英語系二年級學生，研究資料主要來自於學生在現場的學習觀察，以及學生的文字回饋，將資料收集後進行質性分析，分類整理多模態學習對英語口語學習和自我學習策略的影響。研究結果顯示，在多模態學習環境，透過大量的分組任務學習活動中，學生認知自我學習歷程以及學習策略，語言學習方式的自我調整，而除了語言訊息吸收之外，任務學習引導且串聯所學的知識、技能和態度，體驗並深化合作學習所帶來的跨領域素養能力。

關鍵詞：多模態學習、素養能力、英語會話課
