Enhancing students' L2 writing by integrating artificial intelligence with corpus-based language pedagogy

Tanjun Liu  and Bin Zou 

Department of Applied Linguistics, Xi'an Jiaotong-Liverpool University, Suzhou, China

ABSTRACT

As artificial intelligence (AI) becomes more prevalent, a range of benefits for student use has been recognised, such as providing instant feedback to support writing development. However, concerns persist about students' appropriate use of AI in academic writing. Corpora, offering an edge over AI in addressing some of these concerns in language classrooms, have proven effective in enhancing students' writing, particularly by improving the use of lexico-grammatical patterns, which highlights the importance of corpus-based language pedagogy (CBLP). This study, therefore, aims to explore the potential of integrating AI with CBLP in L2 students' writing. The participants were 50 English as a Foreign Language (EFL) learners majoring in English at an English-Medium Instruction (EMI) university in China. They received corpus and AI training and then used their preferred corpus and AI tools in writing revision. During the revision, learners noted down the changes and the tools they referred to. After the revision, questionnaires were administered to examine learners' attitudes towards using the two types of tools and the combination of AI and corpora in writing revision, followed by semi-structured interviews to gain deeper insights. Learners' drafts and revisions were also collected for analysis to explore the changes made by AI and corpus tools. The results showed that learners successfully made a variety of changes in their revised drafts using corpus and AI tools and demonstrated their preferences in actual use: Corpus tools were more significantly used to refine collocations, while AI was more frequently employed for revising sentences. In general, learners held positive attitudes towards the two technologies and their integration in revision. For example, corpus tools were perceived as beneficial in enhancing collocational competence, while AI was considered valuable in generating immediate responses and refining sentences. The study contributes to our understanding of the potential for integrating AI and CBLP in students' L2 writing.

Accepted 21 July 2025

KEYWORDS

Corpora; corpus-based language pedagogy; AI; academic writing

1. Introduction

Corpus-based language pedagogy (CBLP), referred to as using the corpus techniques to facilitate language teaching in the classroom (Ma et al., 2022), has been considered one of the effective pedagogical approaches in second and foreign language learning (e.g. Crosthwaite, 2017; Ma et al., 2023, 2024). A significant proportion of the reported corpus use is concentrated in the field of academic writing. Chen and Flowerdew's (2018) review of relevant research on students' corpus consultation in academic writing has shown us generally promising results. However, CBLP has not become a mainstream teaching approach due to various reasons, such as reported technical issues from learners and a lack of ready-to-use materials for teachers (Boulton, 2010). To facilitate the effective use of corpora in language classrooms, CBLP could be supplemented by other pedagogical methods.

Given the rapid development of artificial intelligence (AI), considerable attention has been drawn to the application of AI in language education. Recent studies have identified various advantages of using AI among students, such as offering personalised and immediate feedback support on students' speaking, reading, writing and listening (Chan & Hu, 2023; Huang et al., 2023). Among these language skills, writing is a potential area in which AI could be particularly useful. There is no shortage of studies exploring students' use of AI in writing recently, for example, by investigating students' perceptions of AI in writing (Kim et al., 2025; Song et al., 2025; Yan, 2023), examining the feedback AI provided (Escalante et al., 2023; Lin & Crosthwaite, 2024), and comparing AI-generated and student writing (Goulart et al., 2024; Jiang & Hyland, 2024). Given the great potential of AI and corpus, more research needs to be carried out to delve into the joint effect of AI and corpus technology in writing. Therefore, this study aims to combine the two technologies and explore the potential of integrating AI into CBLP.

2. Literature review

2.1. Using corpora in L2 writing

Researchers have constantly highlighted the usefulness of corpus use in L2 academic writing (e.g. Chen & Flowerdew, 2018). As argued by Gilquin and Granger (2010, p. 359), one of the advantages of using corpora is that they have an important 'corrective function'. Concordance and collocation outputs can make searching patterns, particularly lexicogrammatical patterns, more salient and thus easily corrected (O'Sullivan & Chambers, 2006). Students' direct corpus consultation can also enhance their independent and discovery learning (Gabrielatos, 2005; Gilquin & Granger, 2010). Instead of being taught the rules by teachers, learners are encouraged to engage in enquiry and speculation, develop the ability to observe patterns in the corpus output and then extrapolate the rules, which helps learners acquire crucial learning skills, such as observing, interpreting and making inferences (O'Sullivan, 2007).

A substantial body of research has shown that L2 learners can effectively correct errors in writing by consulting corpora. For example, Tono et al. (2014) conducted a study to explore how corpus data helped undergraduate students with varying levels of proficiency in revising essays. They found, based on teachers' coded

feedback on grammar, that students made a significant number of corrections to omission and addition errors. Similarly, in Crosthwaite's (2017) research, provided with teachers' highlighted errors, university EFL students effectively used the corpus to correct collocation errors, although morphosyntactic errors were not fully addressed. Direct consultation with corpora has also been successful in self-revising activities for students with relatively higher proficiency levels. Bridle (2019) found that for pre-master's EFL students, 92% of their correction attempts through consulting the corpus were successful. When exclusively focusing on collocations in Hua et al. (2024)'s study, adverbial-modifier collocations were the most significantly improved collocations in EFL graduate students' academic writing.

Existing literature has shown us that the majority of learners found corpus consultation helpful in improving vocabulary and collocation use in writing (Geluso & Yamaguchi, 2014; Liu & Gablasova, 2023; Yoon & Hirvela, 2004). However, learners also reported that the direct use of corpora was challenging. For example, for those with relatively lower proficiency levels, unfamiliar vocabulary in corpora was a barrier (Yoon & Hirvela, 2004). Learners also indicated that their writing challenges were not fully addressed by corpora. For instance, students expected direct answers from the corpus as those generated by automatic writing evaluation tools when revising their drafts (Liu & Gablasova, 2023; Luo, 2016). Sha (2010) also noted that students' direct use of corpora is ineffective at assisting them in accurately paraphrasing sentences. Moreover, technical challenges were frequently reported by learners, as they were expected to have good technical skills to use corpus-analysis software and formulate appropriate queries (Leńko-Szymańska & Boulton, 2015). Potential solutions, such as teachers preparing paper-based concordance lines for students with lower proficiency levels, have been proposed (Yoon & Jo, 2014), but many of these solutions require more time and effort from both students and teachers. With the recent emergence of AI, these issues could be addressed relatively more easily.

2.2. AI and L2 writing

Technology-enhanced L2 writing has undergone a significant change as a result of the recent release of natural language processing models based on the Generative Pre-trained Transformer, such as ChatGPT, developed by OpenAI. The use of AI in assisting students' writing has been extensively examined in recent literature (Chan & Hu, 2023; Edmett et al., 2024; Jiang & Hyland, 2024). Various advantages of AI-generated feedback have been identified. For example, AI can offer timely and immediate writing support on generating writing ideas and structures (Kim et al., 2025; Zhao, 2025), improving cohesion and coherence (Barrot, 2023), correcting grammatical mistakes (Wu et al., 2025), and refining the style (Huang & Tan, 2023). When compared with teachers' feedback, AI-generated feedback was found to be more readable and detailed (Escalante et al., 2023), which greatly alleviates teachers' workload.

While AI has been a remarkable writing assistant, its actual use in students' academic writing can raise many concerns. The first is perhaps academic integrity (Cotton et al., 2023). Students could use AI for content generation for course assignments, which poses challenges to higher education institutions which heavily

rely on written assignments as a type of assessment (Barrett & Pack, 2023). Second, students may become overly dependent on AI tools without adequately developing their learning and writing skills (Edmett et al., 2024; Warschauer et al., 2023) and critical and creative thinking (Barrot, 2023). Additionally, AI can generate misinformation or inappropriate content (Harrer, 2023). The lack of authentic resources poses a threat to the reliability and trustworthiness of the information generated by AI tools. When similar prompts are used to ask the same question, AI may provide different answers. This inconsistency is likely to confuse language learners, particularly those at an early stage of learning, who may lack the ability to judge which response is correct.

Corpora can offer some solutions to these AI concerns. First, while AI may have reliability issues, corpora, carefully considered, designed and compiled according to pre-set criteria, provide authentic resources for language learners to use (Crosthwaite & Baisa, 2023). The outputs based on the specific corpora representative of certain linguistic domains, registers and genres are more trustworthy. Particularly, corpus consultation, supported by the second language acquisition theories of constructivism, the noticing hypothesis and sociocultural theory (Flowerdew, 2015), can improve learners' acquisition of lexico-grammatical patterns and develop their learning and writing skills (e.g. Geluso & Yamaguchi, 2014; Huang, 2014; Muftah, 2023), where AI falls short.

Similarly, AI, being a powerful writing assistant, also brings new opportunities for the development of CBLP. While corpus tools usually expect learners to master some technical knowledge, learners do not need much when consulting large language data in the AI tools (Crosthwaite & Baisa, 2023). Moreover, compared to corpus consultation requiring learners' observation and analysis, the instant and detailed feedback after simply inputting a prompt in AI tools fulfils student writers' urgent needs. Given the complementary advantages of both, as advocated by Mizumoto (2023), it is of great importance to explore the potential of the integration of AI and CBLP. A number of studies have already started some innovative attempts, such as using ChatGPT as a concordancer (Lin, 2023) and incorporating AI in the corpus tool (Anthony, 2024). Although a substantial body of studies has extensively researched EFL learners' AI or corpus use in language classrooms and their perceptions, little research has yet explored learners' actual use of both AI and the corpus in writing. Therefore, this study aims to investigate the potential of integrating AI with CBLP in university students' L2 writing revision by addressing the following research questions:

1. What changes do EFL learners make in writing revision with the assistance of AI and corpus tools? Are the changes appropriate?
2. What are EFL learners' perceptions of using the corpus and AI tools?

3. Methodology

3.1. Participants

A total of 50 English-major students at a Chinese English-Medium Instruction university participated in this study. Fifty-seven students initially joined the study, but seven dropped out after the start of data collection. The participants were a

mixture of final-year undergraduates ($n=4$) and postgraduate students ($n=46$). According to the background questionnaire, the participants had relatively homogenous backgrounds with Chinese as L1 (except for one student whose L1 was Armenian) and proficiency levels. Their proficiency levels were C1, with a few having B1 ($n=4$), based on the scores of their recent proficiency tests (i.e. IELTS, TOEFL and PTE). Most of the students had limited knowledge about corpus linguistics, while five had some knowledge, having either attended a single seminar session on the relevant topic or completed a semester-long module.

3.2. Questionnaires

Two questionnaires were employed in this study: a background questionnaire and a perception questionnaire. The background questionnaire was designed to collect participants' demographic information at the beginning of the data collection: age, recent proficiency tests taken, test scores, English language learning experience and prior knowledge about corpus linguistics. The perception questionnaire (see [Appendix A](#) for the full version), consisting of two parts, was conducted near the end. The first part explored the specific corpus and AI tools learners used in writing revision. The second part consisted of 52 six-Likert-scale questions focusing on six aspects: (i) learners' self-efficacy of the corpus and AI use, (ii) perceived usefulness, (iii) perceived ease of use, (iv) continuance intention, and (v) perceived enjoyment of the two types of tools and their use in revisions respectively, and (vi) general perceptions of integrating AI with CBLP. As the participants were English-major students, one of their career choices would be English language teachers. Therefore, the fourth set of questions also explored their intention to use the tools in their future language teaching. A relatively even number of questions was designed for corpus and AI use, respectively, but there were a few additional questions exploring learners' perceptions of specific concordance and collocation outputs and AI prompts. Learners' attitudes towards the employment of AI and corpus tools in revisions were also investigated in the sixth set of questions. Items for participants' attitudes towards corpora and corpus tools were adapted from Yoon and Hirvela (2004) and Liu and Gablasova (2023). The Likert-scale questions required the participants to indicate the extent to which they agree or disagree with the specific questions, ranging from 'strongly agree' (6) to 'strongly disagree' (1). Internal consistency of the questionnaire was assessed using Cronbach's alpha, demonstrating excellent reliability ($\alpha=.917$). While a formal validity test was impractical due to the limited sample size, to maintain high-quality responses, a few incentives were employed to motivate participants and minimise their fatigue, such as allowing sufficient time for them to complete the questionnaire, providing personalised writing feedback following the participation and offering gift rewards.

3.3. Semi-structured interview

In order to obtain further details about participants' attitudes, a semi-structured interview was utilised following the perception questionnaire. The interview protocols

were designed to align with the key sections of the questionnaire, including participants' self-efficacy about writing and the use of the AI and corpus tools, perceived usefulness, perceived ease of use, and continuance intention, to explore these aspects in greater depth. An additional question was incorporated, asking participants to outline their processes of using the corpus and AI tools respectively in their revisions, to further understand learners' preferences. Ten participants (two males and eight females) were invited to join the interviews and were allowed to answer questions in either English or Chinese. Each interview lasted between 15 and 25 minutes and was recorded with their consent.

3.4. Data collection procedure

The whole procedure of the data collection lasted 10 weeks (see [Figure 1](#) for the timeline of the data collection). In the first week, the background questionnaire was distributed to the invited participants who agreed to participate in the project. Based on the responses to the question regarding prior knowledge of corpus linguistics, participants who indicated little knowledge (including those having received a one-session introduction) received five sessions of corpus training lasting 5 weeks.

The second week's training was an introduction to corpus linguistics covering foundational knowledge and basic techniques, as well as hands-on practice with the corpus tool, Sketch Engine. Two corpora were introduced: the British Academic Written English Corpus (BAWE) (Alsop & Nesi, 2009) and the British National

Figure 1. Timeline of data collection.

Corpus (BNC) (BNC Consortium, 2007). The following four sessions contained writing activities intended to train students to use Sketch Engine in writing revision activities. Participants who had prior exposure to corpus linguistics through a semester-long module received a single training session focused on the application of corpora in revision activities. At the same time as corpus training, participants also received four sessions of AI training. Although the majority of the students had used some AI tools before joining the study, the training session aimed to focus specifically on AI literacy, the introduction of AI tools and applications and their functions. AI tools introduced in the training sessions included AI-powered writing assistance tools, such as Grammarly and Quillbot, and six Generative AI (GenAI) Chatbots, including a university AI platform (built on ChatGPT with ChatGPT 4o being set as the default option), Doubao, Kimi, Zhipu AI, Ernie Bot, and Iflytek Spark. These GenAI Chatbots were selected for introduction because of their accessibility within mainland China and their popularity as AI writing assistants at the time of data collection. The prompts that could be used in writing revision activities were also introduced.

Once the training was completed, a writing revision session was provided for participants to revise drafts with the assistance of the corpus and AI tools. As the revision session was right before the deadline for their course assignments, participants were asked to bring their completed digital written drafts for their subject courses, no less than 500 words, to the session and then employ their preferred corpus and AI tools for revision on their computers or tablets. The writing topics included writing an evaluation report on material design, a critical summary of selected texts, and a research proposal. The session lasted 50 minutes. If participants failed to finish revisions within the time limit, they were allowed to complete them after the session. However, it was explicitly stated that only AI and corpus tools were permitted to be used during the revision process. Additionally, given that academic integrity is always a concern when AI is used in students' writing (Barrot, 2023), and the writing samples used in the study were intended for graded course assignments, participants were reminded that the use of AI for content generation in the revision process was strictly forbidden. To prevent this situation, learners' use of AI in the classroom was carefully monitored by the teachers, who were also the researchers. During the revision process, participants were encouraged to read the passages first and then revise them using the corpus or/and AI tools as they wished. When making the changes, they also noted down the specific changes of any linguistic items they made and the corresponding tools they used, using either the 'Insert Comment' function in the Word document or a separate log sheet (see an example in [Appendix B](#)). Participants were advised not to submit their entire drafts to GenAI Chatbot tools for revision, as this may compromise academic integrity. Drafts and revised versions of students' writing and their log sheets were collected for analysis to compare the differences before and after using AI and corpus tools. Screenshots of their searches in GenAI Chatbots were also gathered as supplementary documents. After revision, the perception questionnaire exploring learners' perceptions of the two tools and the combination of AI and corpora in writing revision was administered, followed by semi-structured interviews to gain deeper insights.

3.5. Data analysis

To answer the first research question, learners' drafts and revisions were compared to explore the changes made. In total, 36 drafts and revisions (and log sheets if applicable) were analysed. We excluded data from participants who failed to provide required documents. It was found that sometimes learners used either one or both types of tools in their revisions. These revisions were categorised based on students' notes on the corresponding tools for specific corrections they made. After the changes were identified, they were coded according to the taxonomies listed in Table 1. The coding taxonomy was adapted from the error types identified by Crosthwaite (2017) and Tono et al. (2014). However, we named the revised parts as *changes* rather than *errors*, as participants made revisions to enhance language and correct errors. The taxonomy includes seven categories: addition, deletion, word choice, grammatical change, collocation, phrase/sentence and academic writing convention. Their definitions and specific examples are also listed in Table 1. For categories 'word choice' and 'collocation', we separated them further into more specific

Table 1. Coding taxonomy.

	Type of changes	Definition	Example
1	Addition	Addition of words, e.g. prepositions and articles	Added 'by' in ' <i>by creating the New York Times US-China Trade War Corpus</i> '
2	Deletion	Deletion of words	Deleted 'the' in ' <i>One unique feature of guo1 is that it is not restrained by [the] time.</i> '
3	Word choice -N Word choice - V Word choice - Adj Word choice -Adv Word choice - Prep Word choice - transition words	Replacement of words with alternatives (e.g. nouns, verbs, adjectives, adverbs, prepositions, and transition words)	Replaced ' <i>characteristic</i> ' with ' <i>variation</i> ' Replaced ' <i>occurred</i> ' with ' <i>happened</i> ' in ' <i>an action that occurred in the present or the future...</i> ' Replaced ' <i>auspicious</i> ' with ' <i>favorable</i> ' in ' <i>... it represents auspicious, authority, while in western culture ...</i> ' Replaced ' <i>primarily</i> ' with ' <i>mainly</i> ' Replaced ' <i>in</i> ' with ' <i>between</i> ' in ' <i>...differences in Chinese and American news reports...</i> ' Replaced ' <i>secondly</i> ' with ' <i>additionally</i> ' in ' <i>Secondly, their industry dominance significantly shapes other traditional media's information choices.</i> '
4	Grammatical change	Change of word tenses, singular and plural forms, etc. due to grammatical mistakes	Replaced ' <i>qualitative analyses</i> ' with ' <i>qualitative analysis</i> '
5	Phrase/sentence	Complete change of phrases or sentences	Replaced ' <i>compelling case study</i> ' with ' <i>valuable research potential</i> '
6	Collocation - N Collocation - V Collocation - Adj Collocation - Adv Collocation - Prep	Replacement of nouns, verbs, adjectives, adverbs and prepositions with alternatives in collocations	Used ' <i>complex concept</i> ' instead of ' <i>complex nature</i> ' Used ' <i>broaden</i> ' in ' <i>broaden ... horizon</i> ' Used ' <i>practical</i> ' in ' <i>practical value</i> ' Used ' <i>extremely necessary</i> ' instead of ' <i>very necessary</i> ' Used ' <i>succeeded in learning</i> ' instead of ' <i>succeeded to learn</i> '
7	Academic writing conventions	Changes related to academic writing conventions, such as British/American spelling and APA format (7th edition)	Replaced ' <i>Fowler & Kress</i> ' with ' <i>Fowler and Kress</i> ' when citing two authors in the body of the text (outside of parentheses)

sub-categories based on the parts of speech of the modified words. The changes were coded by the first researcher and two research assistants with near-native English proficiency. The intraclass correlation coefficient (ICC) was employed to assess inter-coder consistency, with a score of .836 indicating high consistency across raters. The appropriateness of the changes was also cross-checked by the researcher and the same research assistant, with an ICC score of .933, which showed substantial agreement. Given that assumptions of the Chi-Square test were violated (over 20% of the expected counts were less than five), Fisher's exact test was performed to examine whether there were statistically significant differences in the number of changes across different categories between AI and corpus use and whether some categories differed significantly from others for each technology type. When there was an overall statistically significant difference ($p < .05$), a post hoc Bonferroni test was used to identify where the significant difference occurred.

The second research question regarding learners' attitudes was explored based on the analysis of the perception questionnaire and interviews. The specific tools used by learners in the revisions were also investigated. According to learners' responses to the questionnaire, the most frequently used corpus tool by the participants was Sketch Engine (with three other participants selecting Antconc and the Prime Machine), while the primary AI tools employed were three GenAI Chatbots: ChatGPT 4o (including the university AI platform, as it is built on ChatGPT), Kimi, and Doubao. ChatGPT was the most popular one, used by 72% of participants. Kimi and Doubao followed at 44% and 26.9% respectively. Only three participants used Grammarly, and four employed three other Chatbots (i.e. Zhipu AI, Ernie Bot, and Iflytek Spark). For the Likert-scale questions, mean scores (M) and standard deviations (SD) were calculated and reported. Given that the participants were asked similar questions on the two types of tools they used, a paired samples t -test was conducted to compare their perceptions. The interviews were transcribed into a textual form for analysis. Thematic analysis was adopted to code texts and group themes based on the responses in the questionnaire and the questions raised in the interview. In doing this, we looked for repetitions, similarities and differences in the responses to identify recurring themes and topics (Ryan & Bernard, 2003). Pseudonyms were used to protect the participants' anonymity.

4. Results

4.1. Results of writing samples

Table 2 shows the distribution of the changes and the appropriateness of these changes made by learners with the assistance of the corpus and AI tools, respectively. It can be seen that, in general, learners frequently used AI to revise their writing, and the total number of changes was slightly more than twice that of changes using the corpus tools. The analyses based on Fisher's exact test revealed that there were significant differences between the changes made by the corpus and AI tools ($p = .038 < .05$): corpus tools were more significantly used for revising verb collocations ($p < .05$), whereas learners had a significant preference for AI tools in revising phrases and sentences ($p < .05$), based on post hoc analyses using

Table 2. Distribution of changes made using the corpus and AI tools.

Types of changes		Corpus				AI			
		Total		Appropriate changes		Total		Appropriate changes	
		No.	%	No.	%	No.	%	No.	%
1	Addition	5	6.10	5	100	12	7.02	12	100
2	Deletion	7	8.54	7	100	12	7.02	12	100
3	Word choice -N	4	4.88	4	100	12	7.02	12	100
	Word choice - V	12	14.63	12	100	21	12.28	21	100
	Word choice - Adj	7	8.54	7	100	7	4.09	6	85.71
	Word choice -Adv	0	0	0	N/A	1	0.58	1	100
	Word choice - Prep	1	1.22	1	100	6	3.51	5	83.33
	Word choice – article	0	0	0	N/A	1	0.58	1	100
	Word choice - transition words	3	3.66	3	100	3	1.75	3	100
4	Grammatical changes	3	3.66	3	100	15	8.77	14	93.33
5	Phrase/sentence	3	3.66	3	100	31	18.13	30	96.77
6	Collocation - N	6	7.32	6	100	10	5.85	9	90
	Collocation - V	20	24.39	19	95	19	11.11	19	100
	Collocation - Adj	5	6.10	5	100	10	5.85	10	100
	Collocation - Adv	1	1.22	1	100	1	0.58	1	100
	Collocation - Prep	4	4.88	3	75	5	2.92	5	100
7	Academic convention	1	1.22	1	100	5	2.92	5	100
Total		82	100	80	97.56	171	100	166	97.08

Bonferroni. In terms of the appropriateness of the changes, it is noteworthy that both types of tools were effective in revisions, with 97.56% and 97.08% of changes considered appropriate. There were no statistically significant differences across the categories between the two types of tools ($p=.06$).

When examining the specific types of appropriate changes made using corpus tools, collocations were the category in which learners made the largest number of revisions. The revisions involved correcting collocational errors and replacing collocates with more conventional or contextually suitable ones. Among all types of collocations, the most frequent changes occurred in verb collocations, which was also the only type where changes made through corpus tools significantly outnumbered those made using AI. An example with the change highlighted in square brackets is given as follows:

*The programme **uses** [adopts] a simple-to-complex approach to teaching and learning, enabling students to navigate the complexities of the global academic environment at a basic level.* (Sketch Engine; Participant_5)

There was a comparative number of revisions in adjective collocations and preposition collocations between the use of the corpus and AI tools. AI was more frequently employed for revising adjective collocations. Taking Participant 24's revision as an example, she asked Chabot, Kimi, to generate suitable adjectives to collocate with the noun 'possibility' and decided to use the adjective 'high', based on several proposed options.

Learners also used both tools to add missing words, e.g. articles, delete redundancies, and revise (inappropriate) words, although higher frequencies were observed for AI usage. The following example is Participant 36's substitution of the word 'showcase' with a more contextually appropriate synonym:

*According to the latest data from the EF EPI website, Jiangsu ranked 9th among the 32 provinces surveyed, *showcasing [reflecting] the region's strong English proficiency.* (ChatGPT; Participant_36)

As for grammatical changes, more changes were made using AI tools, particularly through Grammarly. For example, based on the suggestions given by Grammarly, Participant 26 added '-ed' in the sentence, 'However, as time progressed, more multi-dimensional characters appeared in mass media,...', when past tense should be used, while Participant 28 removed plural '-s' in the phrase 'provide an empirical *insights [insight]'.

Compared to the corpus use, a notable and frequent use of AI in the revision was to rephrase phrases or sentences. Learners often requested AI's refinement of their sentences and then adopted revised versions generated by AI, as illustrated by the following example:

Original: Despite its strengths, the article acknowledges a gap, emphasizing the need for broader coverage beyond *The New York Times*, extending to diverse regional perspectives and media outlets.

Revised: Despite its strengths, the study acknowledges the limitation of focusing exclusively on *The New York Times*, suggesting the need for a broader analysis including diverse regional perspectives and media outlets. (ChatGPT; Participant_25)

Another unique use of AI by students was to seek advice on academic writing conventions. For example, one of the participants asked ChatGPT for the appropriate in-text citation format to cite an article with two authors (see Table 1, Type 7 example).

4.2. Results of the perception questionnaire

This section reports the results of the perception questionnaire. In terms of self-efficacy, the results indicated that learners showed significantly more confidence in using the AI tools ($M=4.44$, $SD=0.91$) than the corpus tools ($M=3.92$, $SD=0.9$), $t(49)=4.045$, $p<.001$. The effect size was moderate, $d=.572$. The majority of learners also reported they were confident in using AI prompts to revise their writing ($M=4.44$, $SD=0.89$).

Regarding the perceived usefulness of the two types of tools, as shown in Table 3, the majority of learners generally perceived both corpus and AI as useful, with relatively higher mean scores for AI across various aspects, i.e. revising writing (Items 5 and 10), identifying misuses (Items 6 and 11), enhancing writing skills (Items 7 and 12), and enhancing collocational competence (Items 9 and 14). According to the results of a paired samples t -test, among all these items, there was only a statistically significant difference in the perceived usefulness of AI and corpus for writing revision, $t(49)=4.386$, $p<.001$, with a moderate effect size ($d=.620$). The majority of learners also believed that the usefulness of AI in giving good feedback requires appropriate AI prompts (Item 15). However, for vocabulary improvement, learners found corpus tools to be more effective than AI tools (Items 8 and 13), although no significant difference was found.

Table 3. Learners' perceived usefulness of the corpus and AI.

	<i>M</i>	<i>SD</i>
Corpus		
5. In general, I found corpus tools helpful in revising my writing.	4.34	1.03

30. I need more training to write good prompts.	4.6	1.11
31. I find it time-consuming to use AI tools.	3.18	0.96

When it comes to the perceived ease of use (see Table 4), learners held neutral-to-slightly positive attitudes towards corpus tools but generally believed that AI tools were easy to use (Items 16 and 24). The difference was statistically significant, $t(49)=6.92$, $p < .001$, with a large effect size ($d=.979$). Learners also indicated that both corpus and AI tools generated comprehensible responses (Items 17 and 25), but beliefs on AI were significantly higher, $t(49)=4.312$, $p < .001$, $d=.61$. When asked about the challenges related to using corpus and AI tools in writing revision, learners reported moderate levels of difficulty (Items 20 and 27), with significantly greater difficulties observed for the corpus tools, $t(49)=4.245$, $p < .001$, $d=.6$.

Regarding the specific corpus outputs, learners found analysing the concordance and collocation outputs moderately challenging (Items 18 and 19). As for their attitudes towards writing AI prompts, learners generally found it easy to write AI prompts for writing feedback (Item 26).

Maybe due to the difficulties learners experienced, they expressed a need for additional training, both in general (Items 21 and 28) and specifically for writing revision (Items 22 and 29). The need for training was significantly greater for the corpus compared to AI, $t(49) = 5.629$, $p < .001$, $d = .904$ and $t(49) = 4.073$, $p < .001$, $d = .972$. For AI tools, learners also expressed the need for additional training to improve their ability to craft effective prompts (Item 30). Additionally, learners perceived the use of corpus tools as more time-consuming compared to AI tools (Items 23 and 31) with a statistically significant difference, $t(47) = 5.226$, $p < .001$, $d = .754$.

As can be seen in Table 5, learners also indicated their continuance intention to use both corpus and AI tools in their future writing and revision (Items 32 and 37) and showed a willingness to introduce their peers to use these tools (Items 34 and 39), with slightly more positive attitudes towards the AI tools compared to the corpus tools. When they were asked about the potential use of these tools in future language teaching classrooms, learners indicated great willingness but a modest preference for corpus tools over AI tools (Items 33 and 38). Interestingly, learners also reported more trust in the results generated by the corpus rather than the AI tools (Items 35 and 40), which was found to be significantly different, $t(48) = 4.071$, $p < .001$, with a moderate effect size, $d = .582$.

46. I find it enjoyable to write prompts to ask AI to give me feedback.	4.64	0.76

Table 7. Learners' perceptions of integrating AI and corpus tools.

	<i>M</i>	<i>SD</i>
47. When revising writing, I find it useful to combine both corpus and AI.	4.98	0.77
48. I found it easy to combine corpus and AI in revising writing.	4.22	0.94
49. I still have difficulty integrating AI into corpus use.	4.26	1.08
50. I need more training in integrating AI into corpus use.	4.86	1.12
51. I find it time-consuming to use AI tools and corpus tools in revising writing.	3.86	1.27
52. I enjoy integrating AI into corpus use.	4.26	1.13

Table 6 displays learners' perceived motivation and enjoyment. It can be seen that learners felt motivated by using both the corpus and AI tools (Items 36 and 41). However, compared to the corpus tools, learners reported significantly more enjoyment working with the AI tools in general (Items 42 and 44, $t(49) = 4.452$, $p < .001$, $d = .63$) and slightly more enjoyment using AI tools in performing specific tasks (Items 43 and 45). The majority of the learners also enjoyed writing AI prompts for feedback (Item 46).

Learners were also surveyed regarding their attitudes towards employing both corpus and AI tools in revision activities (see Table 7). The majority of learners reported the usefulness of this integration (Item 47) and enjoyed it (Item 52). While most of the learners found it easy to integrate AI and corpus in revision (Item 48), they indicated a need for additional training on the integration of these two types of tools (Item 50), likely stemming from perceived challenges in this process (Item 49). In terms of the time-consuming nature of using both types of tools, learners expressed neutral attitudes (Item 51).

4.3. Interview findings

Similar to the results of the questionnaire, all ten interviewees believed that both AI and corpus tools were beneficial when revising writing. In terms of corpus use, interviewees found corpus techniques, particularly concordance lines and collocations, helpful in checking uncertain vocabulary and phrases, looking for suitable collocates, and differentiating synonyms. For example, two interviewees, Yue and Qu, highlighted the usefulness of the function, Word Sketch, in Sketch Engine, as it showed lists of relevant, filtered and sufficient collocates categorised by parts of speech, which Yue perceived as a 'bonus' because she learned more usage of the searching word beyond her expectations. However, although the majority of the interviewees perceived the corpus tools as easy to use, they reported two challenges with corpus consultation in writing: limited datasets and complex searching procedures. As the recommended corpora (i.e. the BAWE and the BNC) have limited sizes, some interviewees demonstrated difficulty in locating all the phrases. Two interviewees also indicated that corpus consultation was a bit time-consuming due to the complex procedures.

Regarding the use of AI, the major advantages, reported by nearly all interviewees, were AI's rapid generation of responses, targeted answers, and the affordances of revising sentences or paragraphs (e.g. improved coherence). For instance, Quan

reported that she favoured the comprehensive responses generated by AI, often presented in bullet points with explanations, which could be further elaborated upon if additional details or explanations were requested, which was not supported in the corpus tools.

When the two types of tools were compared, interviewees' responses revealed some interesting findings. First, similar to the questionnaire results, most of the interviewees placed greater trust in the results generated by the corpus. They believed that, compared to AI, corpus-generated results were more reliable because their sources could be found. Half of the interviewees expressed concerns regarding the accuracy of the answers generated by AI, and sometimes conducted further examinations. One example given by Haige is that the corpus and AI tools gave her contradictory responses regarding the usage of a specific phrase, 'feel competence'. Upon searching for this phrase in the corpora, she found no occurrences, leading her to conclude that the phrase was rarely used in academic writing. However, when she queried the ChatGPT-supported university AI platform, the response indicated that the phrase was acceptable. Despite her reservations about the AI-generated results, she retained the original phrasing.

Second, some interviewees indicated that their problem-solving skills and collocational competence improved after the corpus use, while being concerned about becoming more dependent on AI. One interviewee, Feng, who has a few years of teaching experience, employed two metaphors of a 'hiking pole' and a 'cable car' to describe his use of corpora and AI, respectively. He likened the use of corpora to a hiking pole, which provided support and guidance to help one become a more skilled climber. In contrast, he compared AI to a cable car—efficient and direct in reaching the destination. However, he cautioned that overreliance on the cable car could diminish one's ability to climb independently over time. Third, given that learners were allowed to use both types of tools, it was found that they had a preference for the use of corpus and AI tools in writing and revision tasks (reported by Haige and Quan): using AI for brainstorming and writing structure suggestions at the beginning stage of writing and refinements (e.g. polishing sentences/paragraphs), but corpus tools for more specific inquiries, such as understanding the use of search words and finding more appropriate collocates.

In terms of their future corpus and AI use, all interviewees indicated their willingness to employ them in future language learning, except for one who indicated that she might not continue using the corpus tool due to insufficient skills. When asked about future language teaching, half of the interviewees seemed to have reservations about introducing GenAI Chatbots to their future students, because of potential students' young ages and lower study levels and uncertainty about unpredictable results generated by AI. However, three interviewees perceived AI as more suitable to be introduced to the students, as AI had more functions to integrate with teaching activities and was more convenient for younger learners to use, while corpus tools could be more suitable for older learners and teachers to use. Two interviewees believed both tools were suitable to use in different writing stages and for different study levels. For example, Quan said she would encourage her future students to use AI in brainstorming while using corpus tools for vocabulary and collocation refinement.

5. Discussion

5.1. *Learners' changes with the assistance of the AI and corpus tools*

The results showed that learners made various changes using corpus and AI tools, with a larger number of changes made by AI, and more importantly, there was a high proportion of appropriate changes by using both tools. This result could be considered a significant success of learners' independent writing revision by integrating AI into CBLP. This also echoes the findings of the questionnaire and interviews that learners perceived both tools as beneficial in their revision processes. The usefulness of the corpus and AI could be the major reason for these successful revisions. Another reason is perhaps that many learners used both AI and corpus tools for the revision of collocations and words to cross-check the answers. Sometimes, when they found unsatisfactory results from one type of tools, they used the other type of tools for answers. This kind of exploration could largely ensure the appropriateness of the changes and enhance students' active and independent learning while addressing the general concern that students gradually lose critical thinking due to overly dependence on AI tools.

Additionally, the results showed that the learners used AI more frequently than the corpus in revisions. This might be related to the reasons that, compared to corpus consultation, which requires learners to spend time observing outputs, interpreting patterns and finally making inferences (O'Sullivan, 2007), AI can offer learners timely and immediate feedback. Previous studies on students' direct use of corpora have shown that time and energy were the major concerns for students (Chan & Liou, 2005; Yoon & Hirvela, 2004). This drawback is very likely to be addressed by the use of AI, particularly when learners were required to make revisions for time-constrained course assignments in this study. Moreover, while corpus tools require complex searching procedures, the editing feature in GenAI Chatbots is straightforward and powerful, providing a wide range of feedback and assistance in students' writing, such as improving vocabulary, grammar, coherence, cohesion and language styles (Barrot, 2023).

When we look at the specific types of changes, the corpus was more frequently and successfully used in revising collocations, particularly, verb collocations, which supports the results of previous studies that L2 learners could effectively correct lexico-grammatical errors in writing (e.g. Crosthwaite, 2017; Huang, 2014; Muftah, 2023). The results also showed that AI, particularly these GenAI Chatbots, were more effectively used in refining phrases and sentences. This corroborates prior research that found AI-generated suggestions effectively rephrased sentences to improve the clarity, cohesion, and coherence of students' writing (Barrot, 2023; Cummings et al., 2024).

Although it is encouraging to observe the successful use of both types of tools in learners' writing revision, it is important to note that learners made a small number of changes in this study in total. Several potential reasons may account for this. First, as the majority of the participants in this study were postgraduates with relatively high proficiency levels, their drafts tended to have relatively fewer mistakes. Second, we must concede that only one class session was given to the learners to revise their drafts. Although these students were allowed additional time to finish the revisions, the majority of them submitted the revisions immediately after the

session. Third, the participant pool was relatively small, with only 36 drafts and revisions collected from 50 participants.

5.2. Learners' perceptions of using the corpus and AI tools

The results of the questionnaire and interviews showed that learners perceived the corpus as beneficial in writing revision, particularly helpful in improving vocabulary and collocational competence. Learners also reported their preference: using corpora for lexicogrammatical use and AI for brainstorming and refining sentences. This largely aligns with the results found in the actual use of both types of tools in their revision practices and is consistent with those reported in many previous studies that the majority of learners considered corpus consultation helpful in vocabulary and collocation learning because of the easy identification of lexical-grammatical patterns (e.g. Liu & Gablasova, 2023; Yoon & Hirvela, 2004) and students' more use of AI in brainstorming and outlining (Barrett & Pack, 2023).

In writing revision, however, learners perceived AI, particularly those GenAI Chatbots, as significantly more useful than corpus consultation and reported significantly greater enjoyment when working with AI. The advantages of AI may explain this preference: the AI tools offer quick and tailor-made feedback on lexicogrammar, sentences and language styles, while corpus tools usually require more technically challenging searching processes, which were considered time-consuming by one interviewee. Another reason may be related to the participants' prior experience. The majority of the participants had limited knowledge of corpora but had previously used AI tools. The prior experience and familiarity with the tools may play an important role in learners' perceptions of AI and corpus tools, as learners demonstrated more confidence when using AI tools compared to corpus tools.

Another interesting finding is that although participants generally perceived corpus consultation as more time-consuming and reported greater difficulties when using corpus tools, they tended to trust corpus results rather than AI outputs if there were conflicting answers. This may be largely a result of their concerns over the 'inaccurate and unintelligible responses' generated by AI (Barrot, 2023, p. 4; Harrer, 2023). Participants in this study who had relatively higher English proficiency levels were able to evaluate the accuracy of the AI-generated feedback and choose the preferred answers. In comparison, corpora demonstrate distinct advantages over AI in terms of data rigidity, authenticity, and replicability (Crosthwaite & Baisa, 2023). While there is clear metadata information on individual texts in corpora, the reference to AI-generated feedback is sometimes unclear. This is perhaps also the reason why half of the interviewees in this study were hesitant to introduce AI to their future students who might have relatively low proficiency levels.

Different from the previous studies reporting technical issues with corpus tools (Liu & Gablasova, 2023), the majority of participants in this study did not report many of these issues, but requested more training on using corpus tools in revision activities. However, the limited size of the existing corpora may present a disadvantage compared to AI.

6. Conclusion

This study examines the potential of incorporating AI in CBLP and reveals some encouraging results. Learners successfully made a variety of changes in writing revision through a combination of both corpus and AI tools. The results also showed that corpus tools were more significantly used in refining use of collocations, while AI was employed for revising sentences. Learners also held generally positive attitudes towards both types of tools, although AI was perceived as more useful in revision activities and easier to use. Several pedagogical implications could be drawn from this study. First, the integration of AI and CBLP demonstrates promising results, suggesting its potential to serve as a valuable teaching aid in students' writing. The two types of tools can be used complementarily for different purposes, with corpus tools for improving collocational competence and AI for refining sentences. Learners can leverage their respective strengths, which collectively contribute to enhancing students' writing skills. Moreover, the successful implementation of corpora and AI in a classroom or outside the classroom requires learners' sufficient knowledge about both types of tools. As can be seen in the results, learners requested more training on both the corpus and AI tools in revision activities, which highlights the importance of equipping learners with both corpus and AI literacy skills. In classroom teaching, there is also a need for teachers to develop AI literacy alongside corpus literacy (Ma et al., 2023).

This study also has several limitations. The first is the small sample size. Due to the small student sample, the generalisation of the results of this study should be interpreted with caution. Future replication studies with a larger number of participants are recommended. Second, the duration of corpus training in this study was relatively short, which tends to be one of the reasons that participants requested more training. Nevertheless, this study sheds some light on the ongoing research on CBLP and aims to contribute to the existing CBLP research by demonstrating some preliminary evidence of integrating AI with CBLP.

Appendix A. The perception questionnaire

Questionnaire

1. Which corpus tool(s) did you use in this session (list all of them): _____

2. Which AI tool(s) did you use in this session (list all of them): _____

Please use the following scale to circle the response that most closely resembles your perspectives.

1: strongly disagree, 2: disagree, 3: somewhat disagree, 4: somewhat agree, 5: agree, 6: strongly agree.

1. I feel confident in using a corpus to revise my writing.	1 2 3 4 5 6
2. I feel confident in using AI to revise my writing.	1 2 3 4 5 6
3. I feel confident in using prompts to revise my writing in AI.	1 2 3 4 5 6
4. I know when to use the corpus and AI tools respectively in my writing and revising.	1 2 3 4 5 6

Perceived usefulness

Corpus:

5. In general, I found corpus tools helpful in revising my writing.	1 2 3 4 5 6
6. Using corpus is helpful for me to identify inappropriate usage (e.g. vocabulary, collocations).	1 2 3 4 5 6
7. I think using corpus can enhance my writing skills.	1 2 3 4 5 6
8. I think using corpus can improve vocabulary.	1 2 3 4 5 6
9. I think using corpus can enhance my collocation competence.	1 2 3 4 5 6

AI:

10. In general, I found AI helpful in revising my writing.	1 2 3 4 5 6
11. Using AI is helpful for me to identify inappropriate usage (e.g. vocabulary, collocations).	1 2 3 4 5 6
12. I think using AI can enhance my writing skills.	1 2 3 4 5 6
13. I think using AI can improve my vocabulary.	1 2 3 4 5 6
14. I think using AI can enhance my collocation competence.	1 2 3 4 5 6
15. AI is useful for giving me good feedback on my writing when I write appropriate prompts.	1 2 3 4 5 6

Perceived ease of use

Corpus:

16. Searching via corpus tools was easy.	1 2 3 4 5 6
17. I can understand the results based on my corpus searches.	1 2 3 4 5 6
18. I have some difficulty in analysing concordance output.	1 2 3 4 5 6
19. I have some difficulty in analysing the collocation output.	1 2 3 4 5 6
20. I have some difficulty in using corpus tools to revise my writing.	1 2 3 4 5 6
21. I need more training in using corpus tools in general.	1 2 3 4 5 6
22. I need more training in using corpus tools in revising writing.	1 2 3 4 5 6
23. I find it time-consuming to use corpus tools.	1 2 3 4 5 6

AI:

24. Searching via AI tools was easy.	1 2 3 4 5 6
25. I can understand the AI-generated answers.	1 2 3 4 5 6
26. I found it easy to write appropriate prompts to ask AI to give me feedback on my writing.	1 2 3 4 5 6
27. I have some difficulty integrating AI tools in revision tasks.	1 2 3 4 5 6
28. I need more training in using AI tools in general.	1 2 3 4 5 6
29. I need more training in using AI tools in revising writing.	1 2 3 4 5 6
30. I need more training to write good prompts.	1 2 3 4 5 6
31. I find it time-consuming to use AI tools.	1 2 3 4 5 6

Continuance intention

Corpus:

32. I will continue using corpus tools in revising my writing in the future.	1 2 3 4 5 6
33. I will teach my future students how to use corpus tools in revising writing in the future.	1 2 3 4 5 6

(Continued)

Appendix A. Continued.

Corpus:	1 2 3 4 5 6
34.I will recommend the use of corpus tools to my peers.	1 2 3 4 5 6
35.I fully trust the results generated by the corpus tools.	1 2 3 4 5 6
36.I feel motivated by using corpus tools in my revision.	1 2 3 4 5 6
AI:	
37.I will continue using AI tools in revising my writing in the future.	1 2 3 4 5 6
38.I will teach my future students how to use AI tools in revising writing in the future.	1 2 3 4 5 6
39.I will recommend the use of AI tools to my peers.	1 2 3 4 5 6
40.I fully trust the results generated by the AI tools.	1 2 3 4 5 6
41.I feel motivated by using AI tools in my revision.	1 2 3 4 5 6
Perceived enjoyment	
Corpus:	
42.I find using the corpus tools to be enjoyable.	1 2 3 4 5 6
43.I enjoy doing tasks with the corpus tools.	1 2 3 4 5 6
AI:	
44.I find using the AI to be enjoyable.	1 2 3 4 5 6
45.I enjoy doing tasks with the AI.	1 2 3 4 5 6
46.I find it enjoyable to write prompts to ask AI to give me feedback.	1 2 3 4 5 6
Integration of AI with a corpus	
47.When revising writing, I find it useful to combine both corpus and AI.	1 2 3 4 5 6
48.I found it easy to combine corpus and AI in revising.	1 2 3 4 5 6
49.I still have difficulty integrating AI into corpus use.	1 2 3 4 5 6
50.I need more training in integrating AI into corpus use.	1 2 3 4 5 6
51.I find it time-consuming to use AI tools and corpus tools in revising writing	1 2 3 4 5 6
52.I enjoy integrating AI into corpus use.	1 2 3 4 5 6

Would you like to participate in the follow-up interview? (This may take around 10–20 min and will be arranged after your assessments, and it can be conducted online.) Please tick/ circle your answer:

Yes No

Appendix B

1) Example of the revised writing

1.1 Background of the Research ↵

News discourse involves the impartial reporting of recent events disseminated to the public. News reports, characterised by objectivity, timeliness, and informativeness, exert substantial influence, playing an indispensable role in contemporary society. They serve as the window through which individuals gain insights into the world (Facchinetti, 2021). ↵

Critical Discourse Analysis (CDA), introduced by Fowler and Kress in 1979 in *Language and Control*, employs functional linguistics to examine the interplay between ideology and rights in discourse, unveiling the intricate relationship between ideology and discourse.↵

2) Example of the log sheet

Searched item	Corpus/AI tool used (functions/prompt) in specific (If you use the same tools for the entire session, just write them in the first line)	Any changes
Characterized Scrutinizes Analyzing ...	Chat gpt Is it necessary to use the exact British or American spelling throughout an article?	Replace it with "characterised" "scrutinises", "analysing" ... Because we are a British educational system.
Fowler & Kress	In APA format, when citing two authors in the body of the text (outside of parentheses), should you use the ampersand ('&') or the word 'and'?	Replace it with "Fowler and Kress"
In the book <i>Langue and Control</i>	In APA format, when citing a book in the text, should you write 'in the book' or directly refer to 'in [book title]'?	Replace it with "in <i>Langue and Control</i> "
